

Movino Installation Guide

Web Site

Installation

Alternative A – Using Drupal

To get all features available, you should build your web site using Drupal (5.x) and install the movino module. Requires PHP and an SQL database. Check the requirements on www.drupal.org for further information.

- Install Drupal (5.x)*
- Install the Movino Drupal module (movino.tar.gz). Make sure it is enabled in the admin interface (<http://www.yoursite.example/admin/build/modules>)
- Adjust the settings for the Movino module (*Administer > Site Configuration > Movino settings*)
 - In the *Servers* tab, add the Movino servers you wish to use
- Adjust the rest of the settings for Drupal (content management, user management, site building etc.)

* see www.drupal.org for further instructions

Alternative B – Standalone PHP application

The most basic functionality is also available as a standalone web application. No SQL database is required.

- Unpack the web frontend (movino.tar.gz).
- Adjust the settings in standalone.ini according to your needs. At minimum, add one video server.
- See standalone_example.php for further details on how to use the web frontend. Can be run as is.
